

Requirements:

- Must be browser-independent and system-independent.
- Must interface with Spotify (using Spotipy).
- Must not allow malicious actors access to the underlying Spotify account.
- Must recommend a song be deleted past a set number of skips and let the user decide whether to delete the song.
- Must be capable of generating new recommendations based on songs the user listens to using Echo Nest and possibly machine learning.
- Must not slow down the browser too much/make efficient use of memory.
- Layout should be self-explanatory.
- Applet should download in no more than a few seconds on a standard machine.
